Plan Creación de Indicadores del deporte en el desarrollo sostenible en Iberoamérica

Seminario presencial de construcción del plan de desarrollo de indicadores comunes que permitan medir el impacto del deporte en el desarrollo sostenible de los países de la región iberoamericana.

Descripción y objetivos:
El seminario tiene como objetivo dar a conocer una propuesta preliminar de indicadores y diseñar una batería de indicadores comunes para medir el impacto del deporte en el desarrollo y el proceso de análisis participativo para su construcción, así como establecer los siguientes pasos para su implementación en la región Iberoamericana.

Dirigido a:
Autoridades y expertos gubernamentales de los países miembros del Consejo Iberoamericano para el Deporte. El perfil requerido para las personas participantes deben ser representantes y/o colaboradores expertos en materia de deporte y desarrollo de las organizaciones gubernamentales que los países miembros del CID.

Lugar:
• Centro de Formación de Santa Cruz de la Sierra

Fecha:
• 08/11/2022 - 11/11/2022

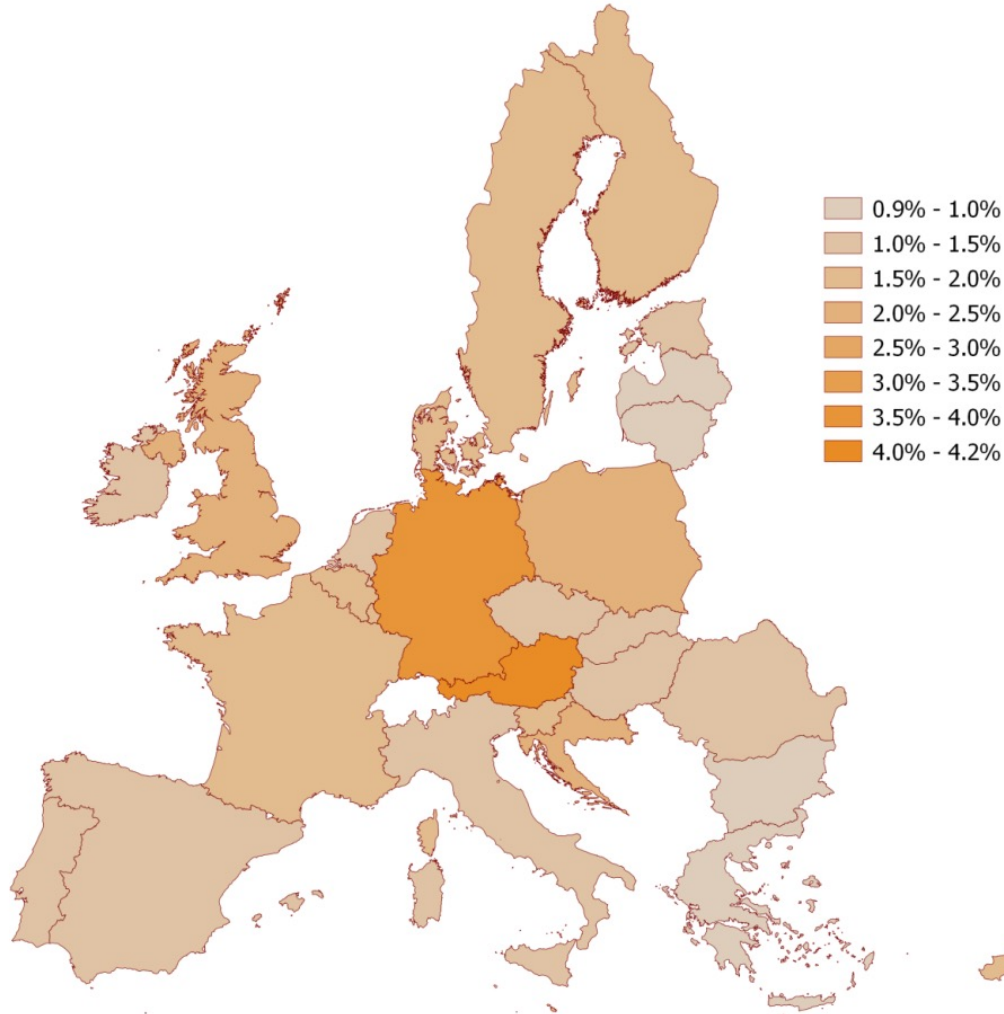

Fecha Inscripción:
• Hasta: 18/10/2022 23:59 (hora española)

Modalidad/ Tipo convocatoria:
• Presencial/Abierta

ANNEX SIX: DIRECT GDP EU-28 MAP

The following map shows the direct sport-related GDP of Member States in 2020 (including UK) presuming that there was no COVID-19 (reference scenario).

Figure 13 Direct sport-related GDP 2020. Reference scenario

Source: SpEA, 2020

Sport is an important economic sector generating growth and employment...

2020 Sport sector value in the EU (November 2020), based on the Sports Satellite Accounts (SSA) methodology:

- sport-related GDP accounted for 310,679 million Euros (2.16% of the total EU GDP)
- sport-related employment equalled 5.22 million employees (2.67% of the total EU employment).

<https://op.europa.eu/en/publication-detail/-/publication/76b94a58-2f3c-11eb-b27b-01aa75ed71a1/language-en/format-PDF/source-175633451>

Study on the Economic Impact of Sport through Sport Satellite Accounts

April 2018

*SortsEconAustria
Institute of Sports Economics*

*Sheffield Hallam University
Sport Industry Research Centre*

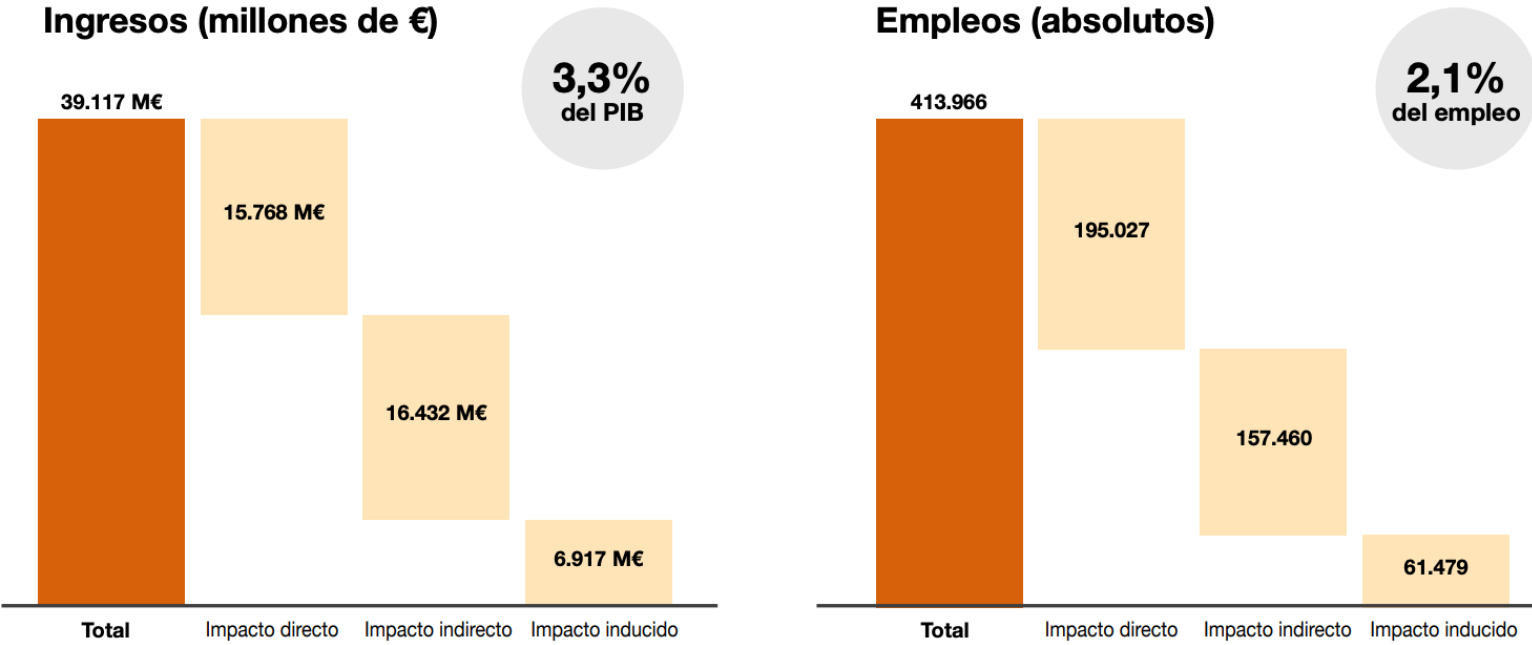

- It was found that in 2012, sport related Gross Domestic Product (GDP) was 279.7 bn Euro or 2.12% of total GDP within the EU.
- In addition, 5.67 m employees could be attributed to sport, a share of 2.72%.
- Stated otherwise, around every 47th Euro and every 37th employee in the EU are directly sport-related.
- These numbers indicate that sport is an employment-intensive economic activity, therefore generating a greater sport share in employment than in GDP.
- In fact, an increase of GDP by 1% goes hand in hand with an additional 1.35% of employment.

Ecosistema del Deporte es un agente económico de 1^{er} orden...

Global, regional and national prevalence of overweight and obesity in children and adults 1980-2013: A systematic analysis

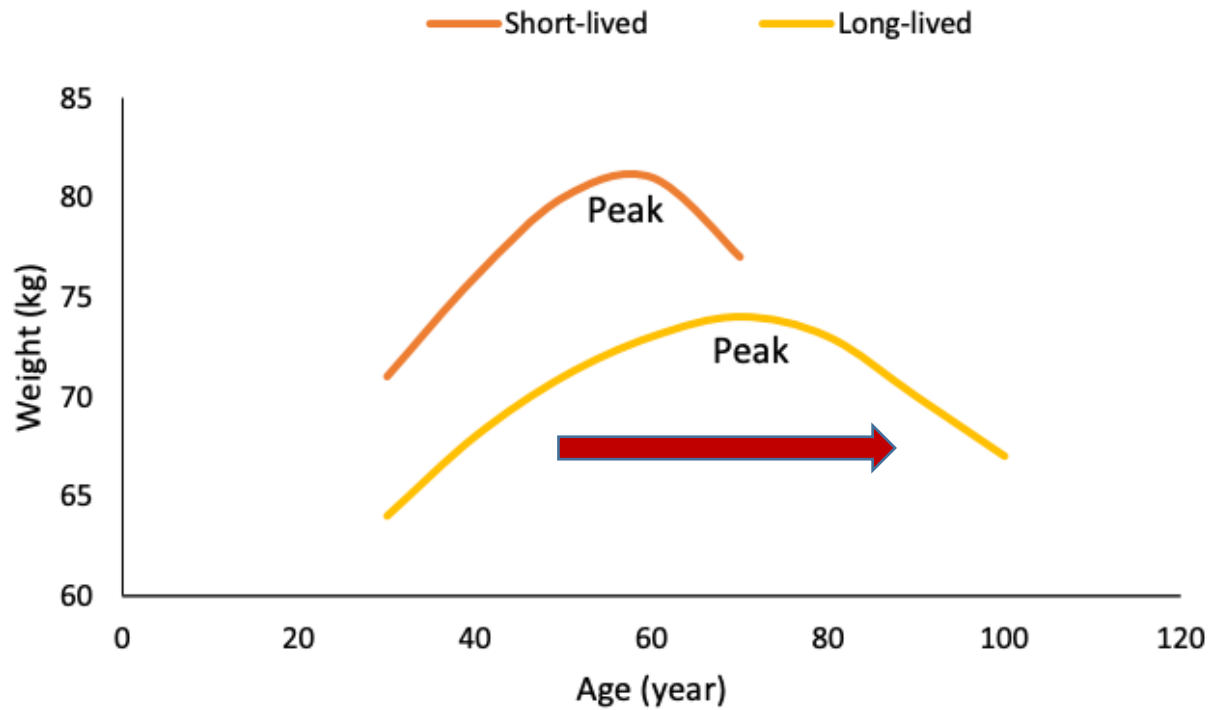

Fig. 2 Rise and fall in weight of human body. Human life is characterized by a long period of growth followed by a short drop in weight. Short-lived men are characterized by a faster growth to peak weight with a quicker weight loss at the end period in contrast with long-lived men. Early rise in weight is probably the cause of earlier and faster weight loss during the end stage. Weight trajectory data from short-lived and long-lived men were reported from Baltimore Longitudinal Study of Aging (1958–2005) observed beginning at age of 19 years until death with illustrated graph reproduced according to Alley et al. [23]

Submitted July 2020
Accepted August 2022

Key points

- The model reported a limited ability to detect modifiable factors affecting physical inactivity, identifying a minimal percentage of inactive individuals correctly.
- The variables asserting the most influence on the model for identifying inactive individuals were having a disability or an illness, not having friends to do sport with, lacking motivation or interest, being afraid of the risk of an injury, and totally agreeing, tend to agree and tend to disagree regarding the extent of local sports clubs and other local providers offering enough opportunities to be physically active vs. totally disagreeing.
- The model was shown to be best designed for active individuals, which is a limitation from a public health perspective.
- New questions should be included in future Eurobarometers, or new surveys should be designed to support the physical activity promotion agenda better.

The economic burden of physical inactivity: a global analysis of major non-communicable diseases

Ding Ding, Kenny D Lawson, Tracy L Kolbe-Alexander, Eric A Finkelstein, Peter T Katzmarzyk, Willem van Mechelen, Michael Pratt, for the Lancet Physical Activity Series 2 Executive Committee*

Summary

Background The pandemic of physical inactivity is associated with a range of chronic diseases and early deaths. Despite the well documented disease burden, the economic burden of physical inactivity remains unquantified at the global level. A better understanding of the economic burden could help to inform resource prioritisation and motivate efforts to increase levels of physical activity worldwide.

Methods Direct health-care costs, productivity losses, and disability-adjusted life-years (DALYs) attributable to physical inactivity were estimated with standardised methods and the best data available for 142 countries, representing 93·2% of the world's population. Direct health-care costs and DALYs were estimated for coronary heart disease, stroke, type 2 diabetes, breast cancer, and colon cancer attributable to physical inactivity. Productivity losses were estimated with a friction cost approach for physical inactivity related mortality. Analyses were based on national physical inactivity prevalence from available countries, and adjusted population attributable fractions (PAFs) associated with physical inactivity for each disease outcome and all-cause mortality.

Findings Conservatively estimated, physical inactivity cost health-care systems international \$ (INT\$) 53·8 billion worldwide in 2013, of which \$31·2 billion was paid by the public sector, \$12·9 billion by the private sector, and \$9·7 billion by households. In addition, physical inactivity related deaths contribute to \$13·7 billion in productivity losses, and physical inactivity was responsible for 13·4 million DALYs worldwide. High-income countries bear a larger proportion of economic burden (80·8% of health-care costs and 60·4% of indirect costs), whereas low-income and middle-income countries have a larger proportion of the disease burden (75·0% of DALYs). Sensitivity analyses based on less conservative assumptions led to much higher estimates.

Interpretation In addition to morbidity and premature mortality, physical inactivity is responsible for a substantial economic burden. This paper provides further justification to prioritise promotion of regular physical activity worldwide as part of a comprehensive strategy to reduce non-communicable diseases.

Funding None.

Global status
report on physical
activity 2022

En **2022 España** ha dedicado el 1,44% de su **Presupuesto a Sanidad**, con lo que el gasto español central en **sanidad** es de **6.606 millones de €...**
(cerca de 90.000 millones de € totales)

Costo de la inactividad física

La carga económica de la inactividad física es considerable. A nivel mundial, entre 2020 y 2030 se producirán casi 500 millones (499 208 millones) de nuevos casos de enfermedades no transmisibles (ENT) prevenibles, lo que supondrá unos costos de tratamiento de algo más de US\$ 300 000 millones (524 000 millones de dólares internacionales) o de unos US\$ 27 000 millones (48 000 millones de dólares internacionales) anuales si no tiene lugar ningún

cambio en la prevalencia actual de la inactividad física. Casi la mitad de estos nuevos casos de ENT (47%) serán consecuencia de la hipertensión, y el 43% de la depresión. Las tres cuartas partes de los casos corresponderán a países de ingresos bajos y medianos altos. El mayor costo económico se producirá en los países de ingresos altos, que representarán el 70% del gasto en atención de salud para el tratamiento de las enfermedades derivadas de la inactividad física.

<https://www.who.int/teams/health-promotion/physical-activity/global-status-report-on-physical-activity-2022>

Este incremento del coste por inactividad en los próximos 8 años (2022-2030) en el mundo supondría **500 millones de nuevos casos de NCDs** y **300.000 millones de US \$**

MORE ACTIVE PEOPLE FOR A HEALTHIER WORLD

WHO, 2018

Inspirational & Aspirational Policy Framework...

KAZAN ACTION PLAN (KAP)

OVERVIEW

GLOBAL OWNERSHIP

Over one-hundred experts and practitioners from governments, UN and IGOs, sports organizations, NGOs and academia, participated in the elaboration of the KAP, adopted in July 2017 by sport ministers

POLICY FRAMEWORK

- Foster convergence in sport policy development
- Measure progress
- Structure and prioritize dialogue and cooperation between different actors
- Specify linkages with the UN Sustainable Development Goals (SDGs)

3 MAIN POLICY AREAS

1. Access for all
2. Contributions to SDGs
3. Integrity

5 ACTIONS

ACTION 1
Elaborate an evidence-based **advocacy tool**

ACTION 2
Develop indicators for sport's contribution to SDGs

ACTION 3
Unify sport **integrity standards**

ACTION 4
Establish a Global **Observatory** for **Women and Sport**

ACTION 5
Create a **clearinghouse** for sharing information

GLOBAL RECOGNITION

[The KAP is] "a voluntary, **overarching reference for fostering international convergence amongst policy-makers in the fields of physical education, physical activity and sport, as well as a tool for aligning international and national policy in these fields with the United Nations 2030 Agenda**"

UNESCO'S General Conference, November 2017

"Establish guidance and toolkits for using the KAP as a **framework for engagement on sport for development and peace (SDP)** across various contexts"

United Nations Action Plan on Sport for Development and Peace, updated in 2018

en.unesco.org/mineps6/kazan-action-plan

[There is a] "growing convergence around the KAP in the alignment of work on sport across the United Nations system, and Member States have begun to recognize its potential as a **pivot point for policy coordination**"

Report of the United Nations Secretary-General "Strengthening the global framework for leveraging sport for development and peace", August 2018

UNESCO, 2019

Figura 15: Principales áreas de actuación del Plan de Acción Mundial sobre actividad física 2018-2030 (WHO, 2018).

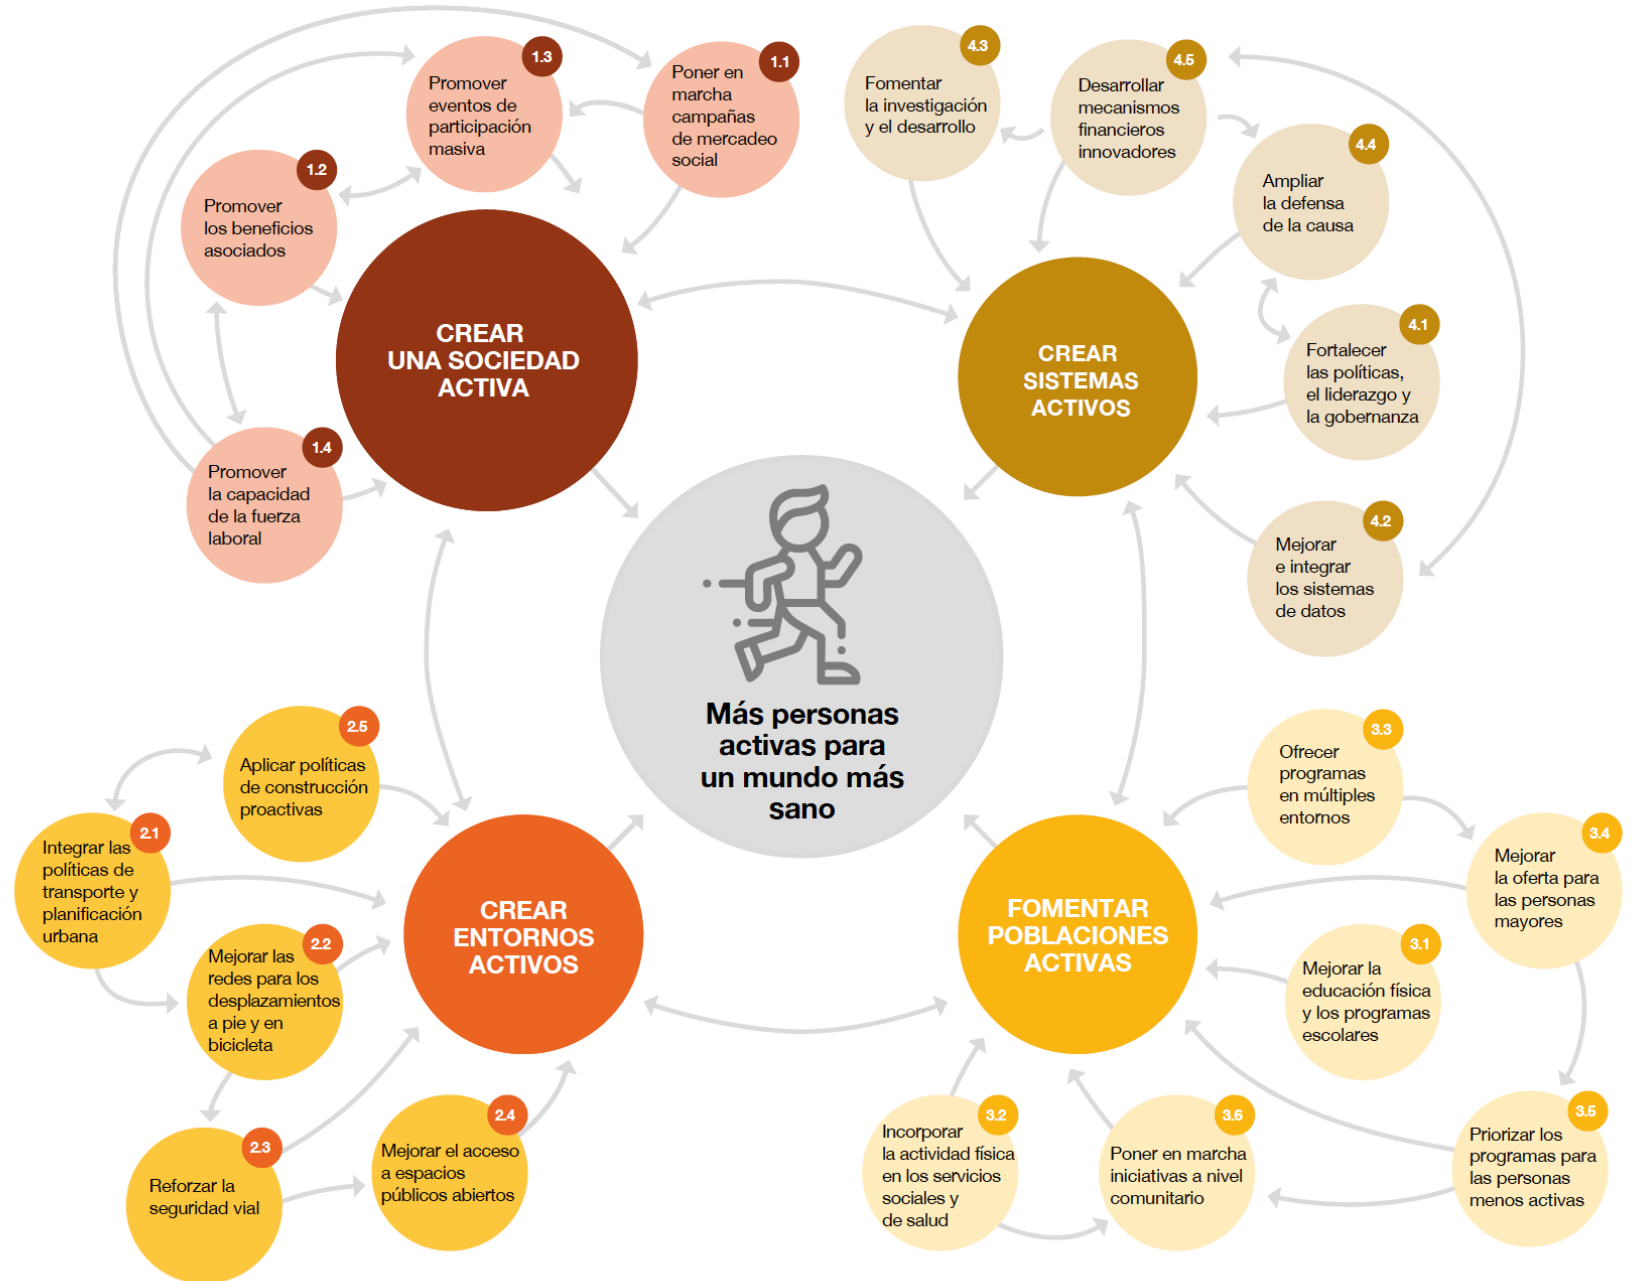

PHYSICAL ACTIVITY HAS MULTIPLE HEALTH, SOCIAL AND ECONOMIC BENEFITS

AND CAN CONTRIBUTE TO ACHIEVING THE 2030 SUSTAINABLE DEVELOPMENT GOALS (SDGs).

Policy action on physical activity is interconnected with 13 SDGs

Working in partnership and investing in policy actions to promote walking, cycling, sport, active recreation and play can promote community well-being and quality of life for all.

Fair Play:

Building a strong physical activity system for more active people

(WHO, 2021)

<https://apps.who.int/iris/bitstream/handle/10665/346169/WHO-HEP-HPR-RUN-2021.1-eng.pdf>

BOX 4

Value Proposition

A **strong value proposition for PA** states what benefits and value will be realized from increasing physical activity. It is a compelling narrative, supported by evidence, empirical data as well as examples of success. It is bolstered by proof of solid returns on investment (ROI), in both short and long term. It should also integrate the responsibilities and commitments endorsed in UN Conventions and universal principles such as fairness and equity.⁷

ARCHIVE

Welcome to the Health Economic Assessment Tool (HEAT) for walking and cycling by WHO

>>> November 2021: Update to HEAT v5.0 with global applicability, including global list of countries, expanded background data, and different user interface options (see news for details). <<<

The HEAT is designed to enable users without expertise in impact assessment to conduct economic assessments of the health impacts of walking or cycling.

What is HEAT?

The HEAT estimates the value of reduced mortality that results from specified amounts of walking or cycling, answering the following question:

If x people regularly walk or cycle an amount of y , what are the health impacts on premature mortality and their economic value?

Next to the health benefits from physical activity, HEAT also allows taking into account the mortality effects of **exposure to air pollution and traffic crashes** while walking or cycling. HEAT can further assess the **effects on carbon emissions** from shifting travel by motorized modes to walking or cycling.

The tool is based on the best available evidence and transparent assumptions. It is usable for a wide variety of professionals at both national and local levels. These include primarily transport planners, traffic engineers and special interest groups working on transport, walking, cycling or the environment.

What can I use HEAT for?

HEAT can be used for different assessments, for example:

- assessment of **current (or past) levels of cycling or walking**, e.g. showing what cycling or walking are worth in your city or country.
- assessment of **changes over time**, e.g. comparisons of “before and after” situations, or “scenarios A (with measures taken) vs. scenario B” (without measures taken).
- evaluation of new or existing projects**, including **benefit-cost ratio calculations**.

HEAT can be used as a stand-alone tool or to provide input into more comprehensive economic appraisal exercises, or prospective health impact assessments.

See **examples of results** you can produce with our local data or scenario [here](#).

EUROPEAN EDUCATION AND CULTURE EXECUTIVE AGENCY (EACEA)

EACEA.A - Erasmus+, EU Solidarity Corps
EACEA.A.3 - Erasmus Mundus, Sport

FORMAL APPOINTMENT AS MEMBER OF THE TASK FORCE ON HARMONISED SPORT STATISTICS IN THE EU

Full name: Task Force (TF SPORT) on the harmonisation and development of sport statistics, including statistics and data on health-enhancing physical activity, social dimension of sport and Sport Satellite Accounts in the EU.

Short name: TF SPORT

Origin: The TF is created to support the discussion about the harmonisation and development of sport statistics, Sport Satellite Accounts (SSAs) at EU level based on existing multi-purpose European data collections and to foster a common understanding and recognition of the less tangible benefits linked with sport and physical activity.

Objective

Building on previous research, the general objective of this TF is to support evidence-based policy-making at both national and EU level by harmonising existing methodologies and definitions on sport statistics thereby also paving the way towards a possible future European SSA.

Measuring the Social and Economic Impact of Sport in England

Report 2: The Economic Importance of Sport and Physical Activity in England

This report was prepared by the Sport Industry Research Centre (SIRC) at Sheffield Hallam University for Sport England.

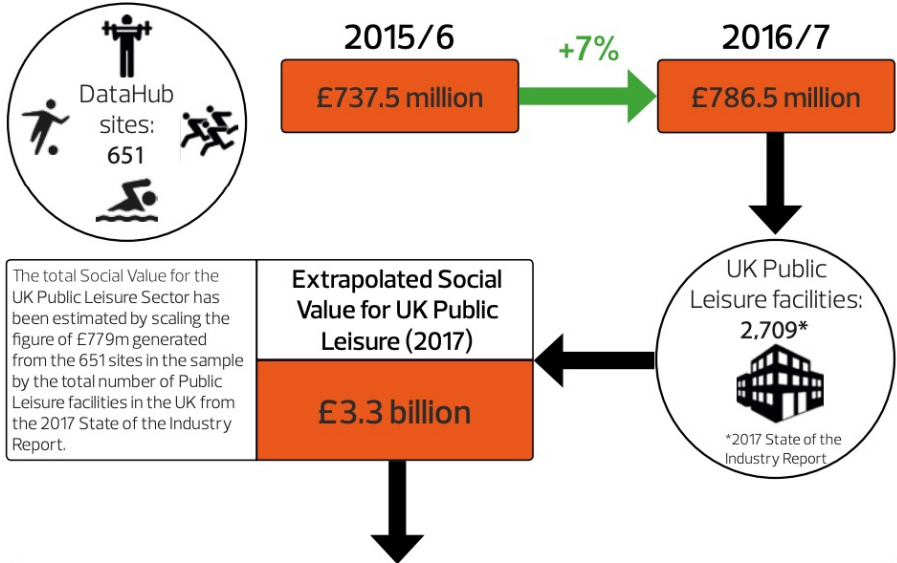

https://www.sportengland.org/how-we-can-help/measuring-impact?section=social_and_economic_value_of_community_sport

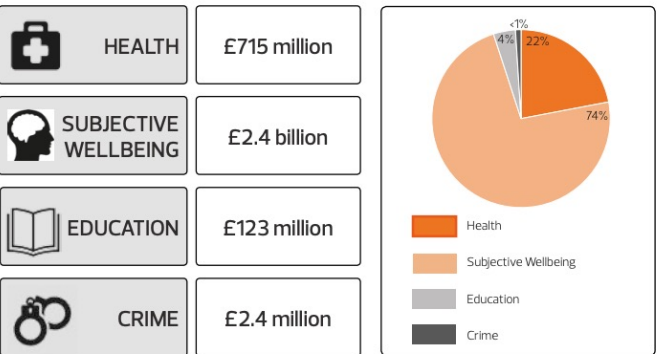

Social Value of the Sector

Data has been taken from 651 public leisure facilities across the UK and processed using the DataHub Social Value Calculator to determine the overall Social Value that these sites are generating. The year used for calculations runs from October to September.

How does this figure breakdown into the four components of Social Value?

The magnitude of these numbers serves to highlight the importance of keeping the already active moving and encouraging the inactive to participate in exercise.

Physical Activity - A Social Solution

Ingesport's social contribution

Estimated savings of **17.4 M€** in healthcare spending on physical and mental illnesses

The more than **114,000 users** who practice exercise in Ingesport's facilities contribute to generate savings in health expenditure of **17.4 million euros**, which is equivalent to the **annual public health expenditure¹ of more than 12,000 Spaniards.**

5.8 M€ estimated savings thanks to lower absenteeism

Practicing physical exercise reduces absenteeism at work², in such a way that would allow users of Ingesport's facilities to save **5.8 million euros**, which is equivalent to **more than 105 euros per user** with a job³.

Improvement of subjective well-being valued at **163 M€**

Subjective well-being⁴ of the users of Ingesport's facilities, evaluated according to their happiness level and satisfaction with life, has been valued at **163 million euros**, which is equivalent to the **average salary⁵ of more than 7,000 Spaniards.**

Increase in the quality of life⁶ valued at more than **58 M€**

The quality of life of the users who practice physical exercise in Ingesport's facilities and who maintain an active life, would increase the productive capacity of these people by **more than 510 euros per user.**

(Under review...)

(2017 data)

Social impact

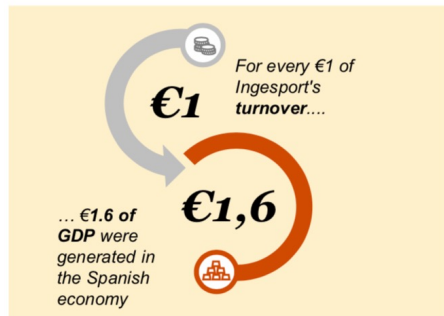

Ingesport's economic and social impact in Spain in 2019

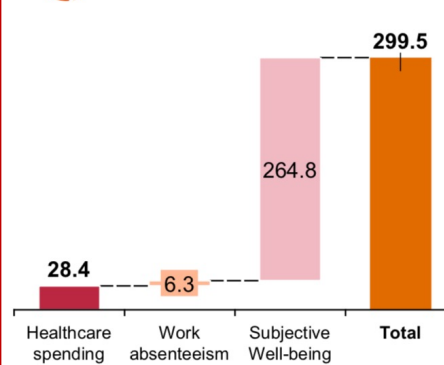

Impact on GDP (€M)

+ € 32.5 M additional GDP due to the tractor effect associated with the increase in sales of sports equipment in Spain

Social impact (€M)*

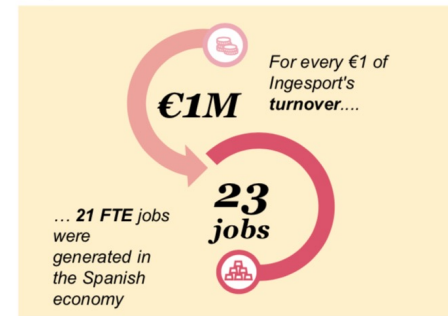

≈ € 100 M additional social benefit due to the improvement in the quality of life of Ingesport's users¹ in Spain

Impact on employment (FTE)

+ 842 additional FTE jobs generated due to the tractor effect associated with the increase in sales of sports equipment in Spain

Social benefit generated through the regular exercise practice in the centers of Ingesport (Millions of Euros)

Communicable diseases Mental illnesses

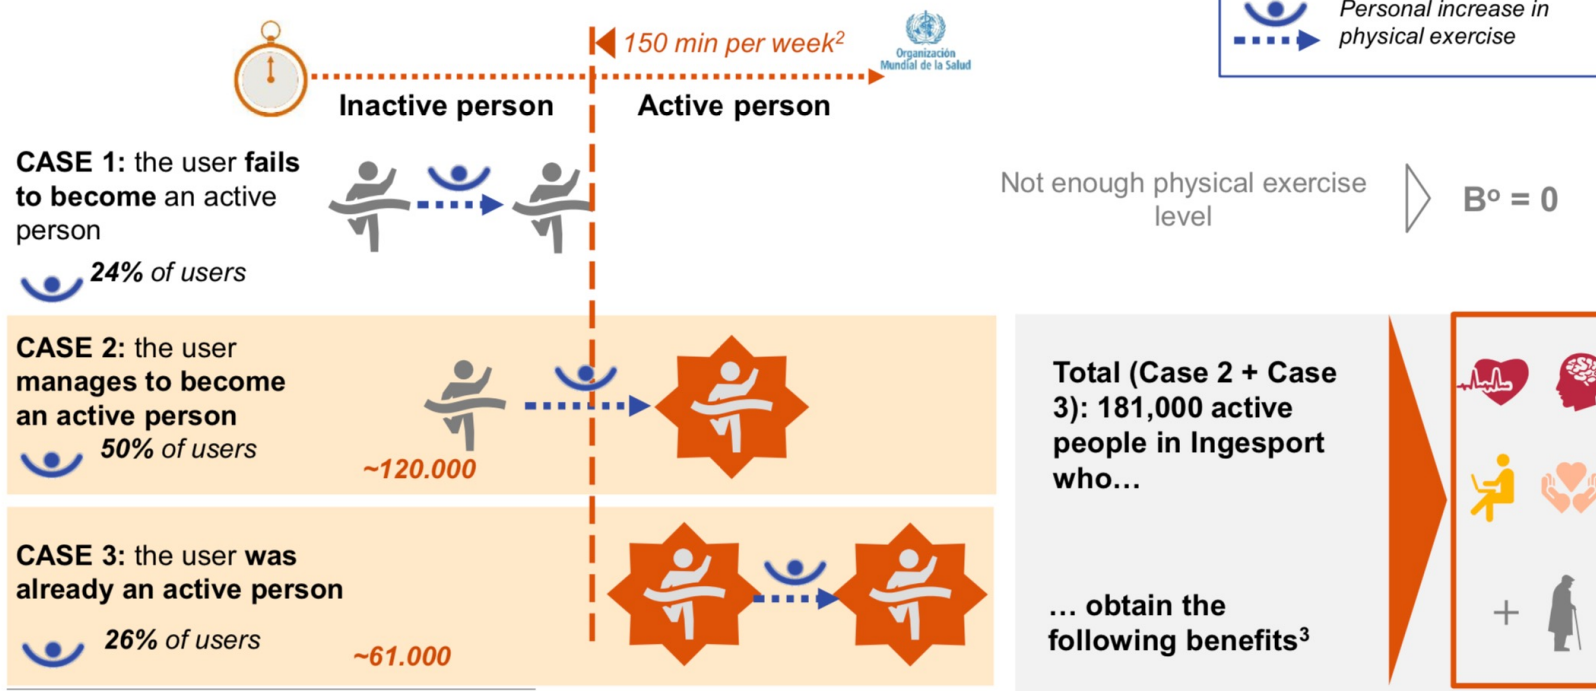

(1) A subscriber is a person who has a contract with Ingesport for the use of its facilities. A user is defined as any individual with the possibility of using Ingesport's facilities, being possible that a subscriber contract includes several users.
PwC (*) Assuming that 100% of active users in the Ingesport centers will maintain the level of activity throughout their lives.

Of the more than 238,000 Ingesport users, 76% (181,000) are currently active people...

Of the more than 238,000 users*, 181,000 (7 out of 10) regularly perform physical activity at the centers, which is 34% more than the sector average¹. Of these 181,000, 66% (120,000) have been activated thanks to Ingesport

Evolution of user activity level due to Ingesport

(1) Source: Ingesport (2017) and statistics published on "Palco 23".

(2) According to the WHO, an active person is one who performs at least 150 minutes of moderate exercise per week of, or 75 minutes of vigorous exercise per week.

(3) Social benefits considered are those of reduction of health expenditure, reduction of work absenteeism, improvement of subjective well-being, and additionally, increase in life expectancy in terms of DALY.

*A member is defined as a person who has a contract with Ingesport for the use of its facilities. A user is defined as any individual with the possibility of using Ingesport's facilities (a member contract may include several users).

Assuming that 100% of active users in Ingesport centers maintain this level of activity throughout their lives, the impact could be close to 300 million euros¹

Social benefit generated through the regular exercise practice in the centers of Ingesport (Millions of Euros)

Social benefit attributable to users activated by Ingesport (Millions of Euros)

SATS Sustainability Report 2020

HIGHLIGHTS

- SATS as a platform for public health contributes to around 8 000 quality adjusted life-years (QALYs) yearly, translating into NOK 11 billion in socio-economic welfare gain
- Significant initiatives implemented throughout the year to activate the Nordic population despite imposed club closures
- Energy consumption per sqm 15% below industry average
- Making people healthier and happier: Significantly improved member satisfaction

STRATEGIC REPORT
SUSTAINABILITY AT THE GYM
CONTINUED

GOOD HEALTH & WELLBEING

Our strategic approach
Regular physical activity benefits both the body and mind. According to the World Health Organization, it can reduce high blood pressure, help manage weight and reduce the risk of heart disease, stroke, type 2 diabetes and various cancers, and increase mental wellbeing.

Our purpose at The Gym Group is to 'Break Down Barriers to Fitness for All'. Through the provision of affordable, high quality, well-equipped 24/7 facilities and a wide-ranging and growing gym network, we are breaking down those barriers to fitness. In doing so, we are supporting the Government's vision to get the nation active. We are also directly contributing to target 3.4 of SDG 3 – Good Health and Wellbeing: to reduce premature mortality and promote mental health and wellbeing.

The outbreak of COVID-19, the link between obesity and severity of the effects of the virus, and the importance of mental wellbeing throughout lockdown have further highlighted the crucial importance of physical exercise.

Inactivity is a threat to the UK's health with 63% of adults overweight or living with obesity!

The social impact of The Gym
In 2020, we commissioned 4Global, a UK-based data analysis company, to determine the social impact of our business over the last five years²³.

Using the Social Value Model created by Sheffield Hallam University, 4Global developed a Social Value Calculator including demographic data from Experian. The model determines the social value of regular exercise on communities, through reduced risk of non-communicable diseases; increased wellbeing; increased educational attainment; and reduced crime. This methodology is used extensively by Sport England, local authorities and Government.

The analysis shows that the social value we delivered increased from £246 million in 2016 to £553 million in 2019. Our number of gyms almost doubled during this period, but this was not the only driver for the increased value; over the same period, the average value returned by each gym increased from £2.8 million to £3.1 million as participation levels grew. By 2019, over 1 million individuals were completing enough activity to elicit health and wellbeing improvements in our gyms, generating an average value of £490 per person.

One of the major factors in social value generation is the socio-economic status of our members. Those from more deprived communities are more likely to suffer from chronic conditions, and therefore the social benefit to keeping these members active will be higher than one from a less deprived community. 32% of The Gym Group's estate is located in the 20% most deprived areas in the UK – reinforcing our commitment to tackling inactivity in underrepresented and disadvantaged communities.

Prevention of non-communicable diseases through exercise is one of the contributors to social value as it significantly reduces treatment cost and GP visits. The positive, immediate impact exercise has on mental health is well documented and the fact that almost 45% of the cases we help to prevent every year are linked to depression confirms the importance of making gyms accessible and affordable.

The COVID-19 pandemic has unfortunately greatly impacted participation levels across the physical sector and fitness industry. Government-enforced closures and restrictions on capacities and activities have affected opportunities for members to access facilities and as a result, the social value we generated in 2020 dropped by 48%, to £287 million.

Value

QUANTIFY YOUR IMPACT ON PHYSICAL AND MENTAL HEALTH USING SOCIAL VALUE

SOCIAL VALUE

The health, wellbeing, educational and social benefits experienced by people, communities, and society through physical activity

With one in ten people dying from lifestyle diseases caused primarily by inactivity, the global sport and physical activity sector is seen increasingly as being valuable, not only for the commercial benefits it provides, but also for the significant improvements physical and mental wellbeing.

Utilising the built in social value calculator, evidence the cost savings generated to local healthcare systems as a result of your members being physically active.

Find out more about social value [here](#).

The European DataHUB...

UNDERSTAND AND MEASURE MEMBERSHIP TRENDS

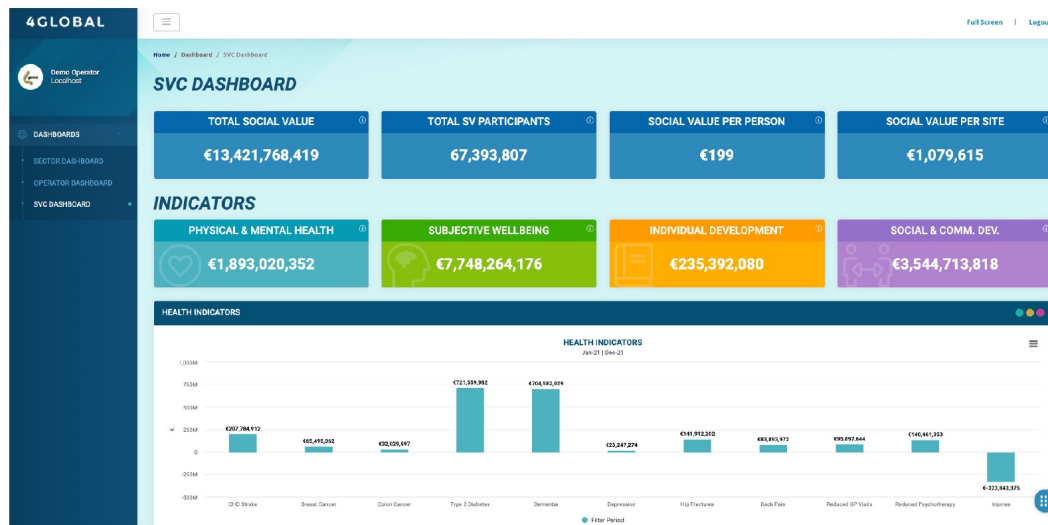

The scale of the European DataHub allows organisations to understand health and fitness membership trends across the sector.

Utilising the platforms performance monitoring capabilities, organisations can better evaluate:

- Throughput trends
- Revenue growth
- Membership growth
- Joiner and attrition rate

The ability to filter by facility type, market segment and country, unlocks enhanced reporting capabilities and insight, enabling more effective investment planning and strategic decisions based on real time data.

Social Value – evidence impact
